

Hello DataAutomation team!

There are many factors which interest me in a position on the development team at DataAutomation. First and foremost, I appreciate that DataAutomation is dedicated to solving the problems of its customers and helping them improve their businesses. I chose to become a developer because I want to help people by solving their problems through software and I feel that this is the mission of the DataAutomation team. I also appreciate that DataAutomation understands the value of clear and open communication. This attitude permeates everything that DataAutomation does. With its client DataAutomation is honest and open through clear pricing estimation and keeps this level of communication through constant meetings and progress reports. For its development teams, DataAutomation expects that every member of the team is willing and able to contribute his or her thoughts. I want to join the DataAutomation team because I want to be part of a development team that understands that great work is done by teams that value open communication.

Given the opportunity, I believe that I possess the tools and mindset needed to become a contributing member of the DataAutomation development team. In fact, an interest in data manipulation is what brought me to programming in the first place. I began programming so that I could do statistical analysis on Chinese social media posts. I recently completed a full-stack application that takes in language content from a variety of different sources including public api's, private api's requiring authentication and webpages for which I build web scrapers. I then automated the process of analyzing the linguistic content of the posts so that my application not only displays posts customized to the user's reading level but also generates a language learning exercise with the post content. By automating this process I am able to provide users with hundreds of new posts to read and study every day. In addition to my background in data manipulation and automation, I understand that DataAutomation is looking for developers who are able to grow and adapt as customer needs change. My background in language, education and development has taught me the skill of encountering new challenges and crafting a plan to overcome them. I have a fascination with tough problems and am always interested following whatever path is needed to solve them.

I understand that at DataAutomation it's about your clients and the businesses they work hard to build. I would love to be part of the software solutions that allow DataAutomation's clients to command more efficient business processes. My goal is to be a contributing member of a development team that requires me to constantly challenge and grow my skills as a developer. Thus, it would truly be an honor for me to join the creative and hard-working teams at DataAutomation. I hope to hear from DataAutomation very soon. In the meantime, if there is anything I can do for the teams at DataAutomation please let me know.

Sincerely,
Paul Storm
